

As a <role>, I want <feature> so that <reason>.

User Story:

As a returning user who already knows where they want to eat, I want to be able to *quickly* find and book a ride to my restaurant, so that I can eat out faster.

Description:

A user who wants to get to a restaurant quickly and already knows where they want to eat is probably a returning user (otherwise they would likely seek out transportation in more familiar a way). This type of user would be logged into our app already, so upon visiting our page they will be greeted with a list of restaurants filtered by distance. Each restaurant listing will have a noticeable call-to-action button on it, which can be pressed to book a ride immediately.

In the likely case that the user's desired restaurant is not one of the first options, a search bar at the top of the page helps them refine their search.

A potential flow for this user may be:

- 1) Load page
- 2) Type part of a restaurant's name into the search bar
- 3) See the desired restaurant
- 4) Click "Book ride" button and be redirected to Uber.com for payment
